URL Parameters	Description
Userid	Your username
Key	Your api key generated

API URL

(Operator synchronize service status check)

Description

To make it simple, just follow these steps to setup S.S.S on your web server:

1. First create a page on your website. Let say you have created servicestatus.php in your home directory and it can be access here:
<http://yourwebsite.com/servicestatus.php>
2. Now just enter this url in joloapi S.S.S box and click on "Set it!" button.
3. Whenever there is change in status of any operator service in our server, the same will be posted on your given url automatically and instantly. In this way you can update your database with real time service status changes and let you keep your customers informed of uptime/downtime.
